Why is this the critical decade?

With climate change, we can expect higher temperatures, more evaporation, less run-off and more extreme weather events. The risk of bushfires will increase. The science indicates climate change is largely anthropogenic (man-made) in origin and we must take steps to mitigate it.

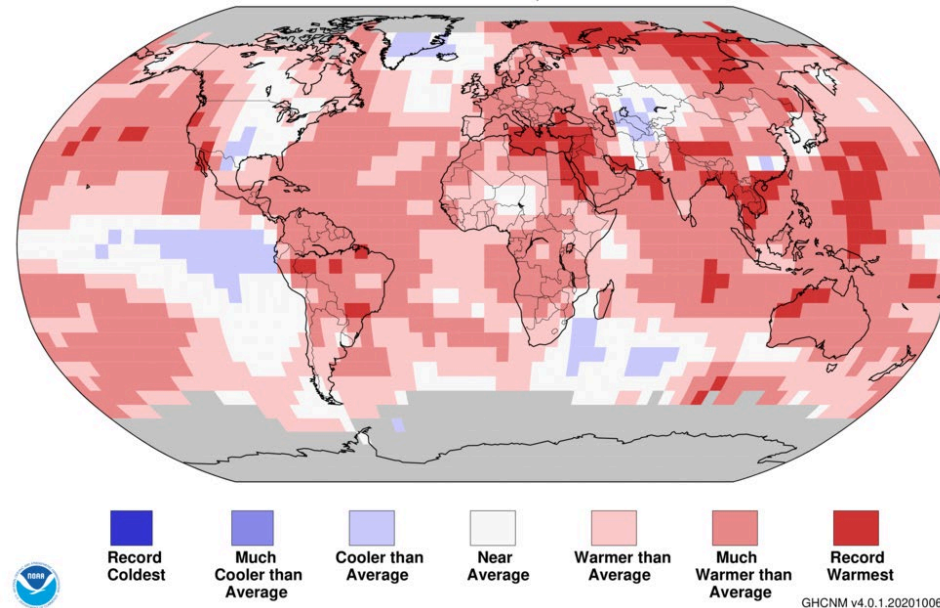

2°C of warming will see the end of the Great Barrier Reef. Yet we are set on a path for 3-4°C warming unless we take radical action to reduce emissions. Scientists now warn we are close to tipping points that will lead to irreversible changes. The time to act is now!

Globally, September 2020 was warmest month ever recorded¹, while 2020 was joint hottest year ever recorded²
